

The label "<<initiates>>" is not standard UML

Insert disc and check if column should be connected

Should be check for game over, as a player can win/draw

Connect 4 Use Case Diagram Review Document:

General Critique of the Design:

The diagram presents a core understanding of the interactions involved in the Connect 4 game. However, there are issues with non-standard UML notation and the separation of related processes into distinct use cases that could be more logically implemented.

Diagram Corrections/Changes:

1. Initiates Label:

- **Issue:** The use of "<<initiates>>" is not standard in UML diagrams.
- **Recommendation:** Remove this label and replace it with a standard line to denote association, which simplifies the diagram and adheres to UML standards.

2. Connection of "Insert Disc" and "Check if the column is not full":

- **Issue:** These actions are currently shown as separate but should be connected more logically.
- **Recommendation:** Integrate "Check if the column is not full" directly into the "Insert Disc" process as a precondition.

3. Renaming "Check for Win conditions":

- **Issue:** This use case should encompass checking for all game end conditions, not just winning.
- **Recommendation:** Rename "Check for Win conditions" to "Check for Game Over" to include checks for win, draw, or if the game continues, enhancing clarity.

Constructive Feedback:

The use case diagram for Connect 4 could greatly benefit from clearer labeling and improved organization to enhance readability. Currently, the use of labels like "<<initiates>>" diverges from standard UML notation, which could lead to confusion or misinterpretation. Adopting universally recognized UML symbols and labels would not only make the diagram more professional but also easier to understand. Additionally, ensuring that all processes are visually distinct yet logically connected can help clarify the flow of actions and decisions in the game, ultimately making the diagram more intuitive and user-friendly. This approach will help maintain consistency throughout the diagram, reinforcing its utility as a reliable design tool.
