

Connect 4 Review Document: Use Case Descriptions / Structure Diagram

Use Case Descriptions:

Critic on the provided Case Description - Placing a Disc:

First of all, it is well written, correctly follows a structured use case format and the logic surrounding the piece drop is written well, but there does seem to be some possible weaknesses.

The Primary Actor Needs to be Clearly Defined: “Game Logic Controller” is listed as the primary actor for “placing a disc”, but who initiates the action? The player? This just helps the use case become more precise.

Overall Critic:

Overall the provided case descriptions are well structured, but some areas can be worked on.

Need To Add More Use Cases: Other than the use case: “placing a disc”, more cases should be added. Specifically for connect 4 this could include: a separate check for a win and draw rather than just being mentioned as a sub-step in the existing use cases. Lastly, although not necessarily a requirement, a nice little feature could be a forfeit option. Overall, making these edits should improve clarity and make sure the game mechanics are all accounted for.

Structure:

The structure diagram is well organized and presents the key components of Connect4. I can't speak much on the relationships purely because I haven't seen the code myself. Just from looking at the diagram, I had one minor criticism about the role of Connect4 being unclear. Connect4 is connected to GameController, so I know it plays a role in the overall game system, but its responsibilities are still unclear. If possible, adding method signatures or renaming it will help clarify its role. But overall, the diagram looks well-structured, and there don't seem to be any problems.
