Tic Tac Toe Review document: Use Case Description / Class Structure Diagram.

USE CASE DESCRIPTION:

- From reviewing the use case description for Tic Tac Toe, it was extremely difficult to navigate the use cases specific to this game.
- Additionally, all the use cases are common for all the games. For instance, cases for win check, draw check, or place piece, should be separate for each game but have been mentioned only once and have been shown as common for all games.
- It would have been better if each game had a separate file for its use cases.
- Also as every game has different conditions for each use case, it is better for every game to have separate use cases and not common.

CLASS STRUCTURE DIAGRAM:

- As I go through the diagram, it looks very well structured and organised.
- All methods and classes have been clearly stated and they do explain to a certain extent what the program will be handling.
- They have mentioned different functions for every win condition - row win, column win, and diagonal win. This approach is very detailed but can be put into one function to make the code more concise and effective.
- Piece and player have been shown as different classes which again don't have much detailed functions.
- Also they have the same diagram for the whole system which becomes a tedious job to locate the specific diagram for the game. But having said that as it keeps everything in one place and shows how everything is connected, I think this approach makes the diagram look very well organised.
