

GROUP: NOVEMBER

Tic Tac Toe Review document: Use Case Description / Class Structure Diagram.

USE CASE DESCRIPTION:

- Very well written and structured. Has a good flow to it, but clarifying the open issues would be a good improvement.
- The document requires more cases to be added, simply adding *place a mark* case is not enough and it should be more precise than that. There should be more descriptive cases for each game presenting all cases.
- Moreover, many cases have been presented as a common use case for all games.
- It would have been better if each game had a separate file for its use cases.
- Also as every game has different conditions for each use case, it is better for every game to have separate use cases and not common.
- Additionally, the primary actor is not very clearly defined. Game Logic Controller is not a very defined primary actor, instead it should have been players or the computer/ system depending on the selected feature.

CLASS STRUCTURE DIAGRAM:

- Framework supports multiple games.
- I can't really see any detailed logic for tic tac toe specifically.
- No methods or functions mentioned, there are just classes which are again not detailed.
- Unclear turn switching mechanism
- The game state management lacks an explicit representation in the diagram.
