

Letter to the Team November

Dear Team November.

We appreciate the opportunity to review your deliverables and provide feedback on both the overall design and specific documents. Below is a consolidated summary of our observations and recommendations based solely on your file summaries.

General Critique

The diagrams and documentation were detailed and mostly accurate. However, there were a few areas where clarity and consistency could have been improved, which impacted the overall understanding of the project. Some of the key issues include missing methods in classes, which affected the completeness of the design, and labels that didn't fully follow UML standards, making the diagrams harder to read. Additionally, there were a few reversed relationships in the class structure, which caused confusion. The layout of both class structure and use case diagram were also quite cramped, making it difficult to follow the flow and connections clearly. Addressing them will greatly improve the clarity and efficiency of the project.

Diagram Correction/ Changes

For the class structure, several classes such as TicTacToe, TicTacToeModel, Connect4, Chess, and others were missing methods, making it difficult to understand the specific responsibilities of each class. Additionally, some relationships were reversed. For example, the composition relationship between the UserAuthentication() class and the UserProfile() class is incorrect. The arrow should point in the opposite direction; UserProfile() should be the main entity, and UserAuthentication() should be dependent on UserProfile(). A similar issue exists with the GameHistory() and RankingSystem() classes. In this case, RankingSystem() should depend on GameHistory(), not the other way around. Moreover, many relations were missing multiplicity notations, which are crucial for understanding the cardinality of the relationships between entities.

In the use case diagram, there were labels like <<initializes>> that are not part of standard UML. To maintain consistency and accuracy, it's important to stick to standard UML labels. Since the flow of use cases appears to be sequential, the UserProfile, History, and GameSelection use cases should be placed after the Login case. Additionally, use cases connected to UpdateProfile should either be linked with a dotted line and the <<extend>> label or with a solid line without an arrow. These adjustments would help improve the diagram's clarity and adherence to UML standards.

Feature Requests

(1) Forfeit Option for Tic-Tac-Toe and Connect 4:

This proposed feature is both practical and essential for improving the overall user experience. By introducing a forfeit option in games like Tic-Tac-Toe and Connect 4, players will have the flexibility to surrender a game if they no longer wish to continue, whether due to losing interest, a change in availability, or an unexpected issue. This feature gives users more control over their gaming experience and prevents players from feeling stuck in a game they no longer want to play. It will also improve the flow of the game system, ensuring that matches are concluded efficiently without unnecessary delays.

(2) Multi-Factor Authentication (MFA) for Enhanced Security:

This feature is vital for ensuring the safety and security of users on the platform. Multi-factor authentication (MFA) adds an extra layer of protection by requiring users to verify their identity through more than just a password. This would typically involve a second authentication method, such as a one-time password (OTP) sent to a mobile device or email, or through an authentication app. This would give users greater confidence in the security of their accounts and personal data.

Feedback

Commend to team for the hard work and effort put into the project. The diagrams and documentation were well-detailed and mostly spot on, which is a testament to the dedication each of you has contributed. However, there are a few areas where we believe we can improve. While these aspects do not diminish the quality of the work overall, addressing mentioned issues and adding practical features will improve the clarity and efficiency of the project.
