

Use Case 6: View Friend's Profile

Iteration: 2

Primary Actor: Player

Goal in context: The player accesses a friend's profile

Precondition(s):

- User is logged on to the system
- User is connected to the user (friend) as a friend in the system

Trigger: The player attempts to view a friend's profile

Scenario:

1. The player selects a friend and attempts to view their profile
2. The system displays to the player the friend's profile page

Postcondition(s):

- The player is presented with the friend's profile page

Exception(s):

- If the friend does not exist in the player database at the time when the user tries to access the profile, the system will not be able to present the profile page of that user.

Priority: High

- As the project is focused not only on the games, but also on community interaction, a core social feature like viewing a friend's profile is of high priority.

When available: When player is in the home page and not in a game

Channel to actor: User profile Interface

Use Case 7: Friends Status

Iteration: 1

Primary Actor: Player

Goal in context: check or display the friend's current online/offline status or other presence information.

Precondition(s):

- The friend exists in the player database

Trigger:

- The user enters the friend's profile page

Scenario:

1. The user enters the friend's profile page
2. The system checks the friend's current status information
3. The friend's status information is displayed to the user through the interface

Postcondition(s):

- The user is able to see the friend's current status information on the profile page

Exception(s):

- If the system fails to find the friend's data in the database and fails to display the profile page, this sub-function cannot take place.

Priority: High

- This function is crucial for the community interaction aspect of the project because this process allows the players to see if a friend is available to play games, or at least receive messages, without having to go through unnecessary steps required to contact them.

When available: Whenever the player access a friend's profile page

Channel to actor: User profile Interface

Use Case 8: User Status

Iteration: 1

Primary Actor: Player

Goal in context: allow a user to view or set their current status

Precondition(s):

- Player must be online
- Player must not be restricted or suspended

Trigger: The user enters the interface for their profile/profile edit

Scenario:

1. The user enters the profile(edit) interface
2. The user views/changes their status information
3. The system receives the changes and displays the updated values

Postcondition(s):

- The user's status information is updated and the updated value is correctly displayed in the user's profile

Exception(s):

- If the user's account does not have the permission to change their status, they cannot change their status information

Priority: Medium

- Is not a necessary function to exist, but users often prefer to see this option available than not.

When available: When an unrestricted user enters their profile page

Channel to actor: User profile interface

Use Case 9: Reset Password

Iteration: 1

Primary Actor: Player

Goal in context: Assist a user who has forgotten or wants to change their password without being fully logged in

Precondition(s):

- The user's account and password must exist in the database.
- The user must be verified to be the account's owner.

Trigger: The user enters the page for requesting password reset

Scenario:

1. User enters the page for password reset
2. The user requests password reset
3. The system receives the request and verifies the user's ownership of the account
4. The user is verified and is shown the password reset interface
5. The user enters the new password
6. The system receives the new password and updates the user's account information
7. The user's password is reset

Postcondition: The user is able to log in with the new password they set.

Exception(s):

- The user fails to verify themselves to be the account's owner.
- The user enters their old password as the new password. The user is prompted with the issue.
- The new password entered by the user does not meet the minimum requirements to be a valid password

Priority: High

- This function is of extreme importance as a flawed password reset system can take away the user's ability to access the program

When available: When user desires to reset password, and is on the reset password interface

Channel to actor: Log-in interface

Use Case 10: Delete account

Iteration: 1

Primary Actor: Player

Goal in context: Permanently remove the user's account and all associated data

Precondition(s):

- The user's ownership of the account is checked before deletion
- The user has been prompted with the consequences of deleting the account

Trigger: The user selects the interactive element for account deletion

Scenario:

1. The user selects the interactive element for account deletion
2. The system checks the user's identity by having the user type their password
3. The user enters the correct password and is prompted with a pre-deletion warning containing consequences of deleting the account
4. The user requests the account to be deleted
5. The system accepts the request and deletes the account and all associated data in the database after logging the user out.

Postcondition:

- The user's information should not be found anywhere in any database

Exception(s):

- The user fails the authentication process

Priority: High

- This is not a frequently used function, but due to data privacy and ethical considerations, it is important that the user is given the ability to have their data deleted off the database.

When available: User is logged-in, active, and not in a game

Channel to actor: Lobby interface
