

Review of GUI Use Case Descriptions of Kilo:

After reviewing the use case descriptions provided by Kilo, I am impressed by the exceptional effort and thoroughness shown by the team. The identification and detailed description of potential use cases demonstrate careful and meticulous work.

Strengths:

1. Comprehensive identification of use cases.
2. Clear and detailed writing for each scenario.

Areas for Improvement:

1. Formatting Issues:

Some Use Case headings are separated from their content by page breaks. Adjusting formatting would result in a more professional and easily readable document.

2. Consistency of Primary Actors:

The current use cases alternate between "User" and "Player" as primary actors. For clarity and to avoid ambiguity, I recommend selecting one term consistently throughout the document.

3. Corrections to Use Case 6 (User Profile Update):

The primary actor is incorrectly specified as an action ("Change username, email, profile picture"). Actors must always be individuals or external entities (e.g., User, Player, System Administrator). The correct primary actor should be "User."

The trigger description includes redundancy: "The user is already logged into their account" is mentioned in both the trigger and the preconditions. Remove this phrase from the trigger to avoid repetition.

4. Combination of Use Cases 2 and 3:

"2. Use case : Profile setup during account creation" and "3. Use case: Create Profile" could be combined into a single use case. Both describe the same core action, setting up a profile during account creation. Consolidating these will eliminate redundancy

5. Logout Button (Use Case 7):

Consider adding a confirmation prompt when the logout button is clicked to prevent accidental logouts.

6. Add a Friend (Use Case 10):

Clarify explicitly if adding a friend requires acceptance from the receiving party (i.e., implementing a friend request system).

7. Player Search Profile(Cse Aase 12):

You raised the concern about handling similar usernames or IDs. However, since profiles are created with unique identifiers, this issue does not arise and can thus be disregarded.

Feature request

While playing Play Solo Mode. I Suggest implementing functionality to save and load board configurations. Also, Automatically save game results upon completion.

Missing Essential Use Cases:

1. Reset Password Functionality:

Currently missing from the documentation. It is essential to include a "Reset Password" use case covering scenario such as forgotten passwords.

2. Delete Profile Functionality:

Also missing from current use cases. It is crucial to add a "Delete Profile" use case outlining detailed steps for confirming account deletion, data removal procedures, and related policies to ensure comprehensive account management.
