

Feature Request 1: Friend Request System with Privacy Controls

- **Description:** Implement a friend request system that allows users to send and receive friend requests rather than automatically adding players to their friend list. Additionally, provide users with more control over the privacy of their friend list, including options for who can send them friend requests.
- **Expected Impact:** This feature would provide users with a more deliberate and secure way to manage their friends list. By introducing friend requests, users can control who they add to their network, which enhances privacy. It also provides flexibility for users who may not want to receive unsolicited friend requests.
- **Implementation/Suggestions:**
 - When users search for other players, instead of immediately adding them as a friend, there will be an "Add Friend" button that sends a friend request to the selected player.
 - The recipient of the friend request will have the option to accept or reject it.
 - Add a setting in the user profile to control who can send friend requests (e.g., "Anyone," "Friends of Friends," "Only People I Follow").
 - Notify users when they receive a friend request and allow them to approve or decline it directly from the notification or friend request section in their profile.
 - Include options for users to block players or report inappropriate behavior, particularly in the context of friend requests.

Feature Request 2: Profile Privacy and Customization Features

- **Description:** Enhance the user profile setup by providing more customizable privacy settings. Allow users to control who can view their profile, send friend requests, and message them. This could include options for profile visibility (e.g., public, friends-only, private), as well as detailed privacy control over personal information like bios and favorite games.
- **Expected Impact:** This feature would give users more control over their data and help protect their privacy, especially in a social gaming environment where some users may prefer to limit access to their profiles. It will also make the platform more user-friendly by offering granular privacy controls.

- **Implementation/Suggestions:**

- During profile setup, add a step that asks users to select their preferred profile visibility setting (public, friends-only, private).
- Allow users to manage these settings at any time through the profile settings page.
- Include options to allow users to toggle whether or not they are searchable by username or if their game activity is visible to others.
- Implement user permission levels (e.g., allowing friends to send messages or view certain sections of the profile).
- These feature requests aim to improve user experience by providing more flexible and secure authentication and profile management options.
