

Feature Request 1: Multi-Factor Authentication (MFA) for Enhanced Security

- **Description:** Introduce an **optional** multi-factor authentication (MFA) feature to improve account security. This would require users to verify their identity using a second authentication method, such as a **one-time password (OTP) sent via email or mobile device**, in addition to their password.
- **Expected Impact:**
 - Protects user accounts from unauthorized access, even if credentials are leaked.
 - Reduces fraud and increases trust in the platform's security.
 - Aligns with modern cybersecurity best practices for account protection.
- **Implementation/Suggestions:**
 - Users can **enable or disable** MFA from their **profile settings**.
 - If enabled, after entering their password, users must enter an OTP sent via email or SMS.
 - Add a **“Remember this device”** option for users who don't want to authenticate every time.
 - Implement a **backup method** in case users lose access to their email/phone.

Feature Request 2: Friend Online Status Indicator

- **Description:** Introduce a feature that allows users to see whether their friends are currently online or offline. This will help users quickly identify which of their friends are available for games, communication, or other interactions within the platform. The status can be displayed on the user's friends list or within the game lobby.
- **Expected Impact:**
 - Improves social engagement by making it easier for users to know when their friends are available to play games or chat.
 - Reduces wait times and improves the matchmaking experience, as players can see at a glance which friends are active and ready for interaction.
 - Encourages spontaneous interaction, as users can see when their friends are online and start a game or conversation quickly.

- **Implementation/Suggestions:**

- Display a simple "Online" or "Offline" label next to each friend's name in the friends list or game lobby.
- Real-time updates to the status: Users' status should automatically update as they log in or out of the platform.
- Allow users to toggle their privacy settings to either display or hide their own online status from others.
- Optionally, provide a notification or alert to inform users when a friend comes online, helping them connect at the right time.
