

November- GUI Wireframe

The current GUI wireframe effectively displays the flow of the platform clearly with a focus on core functionalities. The design lays a solid foundation for how user interactions with the GUI might look like. Some suggestions for improvement would be:

- Add wireframes for the basic layout of each game, to provide visual representations of what users can expect during gameplay.
- Include a wireframe displaying a **Logout** functionality.
- Include wireframes for **Searching** and **Adding Friends**. Highlight how they can send, receive, and manage friend requests.
- Add a **Manage Profile** wireframe, show how users can update personal information, reset their password, and delete or deactivate their account

Implementing these changes would create a more detailed flow for the platform and further improve the development process as all key functionalities would be visually mapped out beforehand.
