

General Critique of the Design

Kilo Group:

- Their project is not real online networking; they use stubs to fake multiplayer actions.
- They use simple booleans (true/false) to decide if the game is on or whose turn it is, which may not work well when the game gets more complicated.
- They do not explain clearly how different parts of the game (like move checking and player handling) will work together.
- Their design might be okay for early tests, but it might need a big change later if they add real networking or AI.
- They do not talk much about testing or checking if everything works correctly.
