

Networking Feature Proposal Document - Kilo

Feature 1: Reconnect After Disconnection

Description and Benefits:

This feature enables players to reconnect to an ongoing game after disconnection due to network issues. The game pauses temporarily, allowing a short reconnection time(1-2 min), preventing unfair losses, improving user experience, and reducing frustration for both players.

Feasibility:

The system saves the game state temporarily when a player disconnects, notifying the opponent. If the player reconnects within the time limit, the game resumes; otherwise, it ends, and the opponent wins. This is feasible due to modern game servers' capabilities for temporary storage and reconnection. The development effort is moderate but enhances user experience.

Feature 2: In-Game Network Health Check

Description and Benefits:

This feature offers a quick network health check before online games, testing connection to the server and displaying status based on ping, packet loss, and stability. It helps players understand connection quality, reducing lag and disconnections, and encourages fixing or switching networks.

Feasibility:

The system conducts a quick network test when "Play Online" is selected, measuring ping, packet loss, and stability. This practical feature, requiring low to moderate development effort, enhances user experience by displaying a simple status message.
