

Networking Feature Proposal Document - November

Feature 1: Reconnect After Disconnection

Description and Benefits:

This feature enables players to reconnect to the game after disconnections, saving the game state for 1-2 minutes. It prevents progress loss, enhances user experience, and makes the game more user-friendly by allowing continuation from the point of disconnection.

Feasibility:

The game already has a system to update states and retrieve data, so saving the game state temporarily and allowing reconnection should be feasible. The networking team can use the existing WebSocket server to manage reconnection requests.

Feature 2: Ping and Latency Check

Description and Benefits:

A ping and latency check feature displays real-time connection quality, warns of high ping, and helps players optimize internet for smoother gameplay.

Feasibility:

The networking team already handles network connections and update states, so adding a ping check should be straightforward. The system can send small packets of data to the server and measure the response time, then display it to the player.
