

Connect 4 Use Case Diagram Review Document:

General Critique of the Design:

The Connect Four section within the Online Multiplayer Board Game Platform use case diagram provides a foundational overview of game integration into the platform. However, the diagram lacks detailed representation of game-specific functionality and does not clearly define how game outcomes (win/loss/forfeit) are handled. This lack of detail could hinder the understanding and development of the game's functionalities.

Diagram Corrections/Changes:

1. Game-Specific Functionality:

- **Issue:** The diagram lacks detailed use cases specific to Connect Four gameplay, such as player actions and game mechanics.
- **Recommendation:** Integrate detailed use cases for "Place Disc" and "Check Column" to provide a complete view of the game mechanics.

2. Outcome Handling:

- **Issue:** There is no clear depiction of how game outcomes like winning, losing, or forfeiting are processed within the Connect Four game.
- **Recommendation:** Add use cases for "Check for game over", and "Check Forfeit" to clearly manage all potential game endings.

Feature Request: Undo Game Move, and Select Fruit (Color)

- **Undo Game Move:** If you make a move, you regret you can have an option to undo. This feature lets you reverse your last action, keeping everything fair and strategic.
- **Select Fruit (Color):** A player should be able to play with their favorite fruit (Disc) if they wish to. This is a fun idea to align with the players' wishes, adding a personalized touch to each game. But keep in mind both players cannot play with the same fruit(color).
- **Expected Impact:** These features are all about giving you more control and fun in your gameplay. The 'Undo Game Move' is perfect for those moments when you just need a second chance. 'Restart Game' lets you wipe the slate clean and challenge your friend again. And 'Select Fruit (Color)' adds a playful twist to your game setup, making it visually appealing and personalized.

Implementation/Suggestions: Here's how you guys can plan to bring these ideas to life:

- The "Undo" button will appear right after you make a move. It stays active for 5 seconds, then opponent can take their turn, giving you a chance to rethink your strategy.
- As for selecting your fruit, you'll get to choose from a vibrant selection of fruits and their colors at the start of each game. Fruit(color) must be distinct to each player. Meaning both players can't select the same fruit

Constructive Feedback:

The current separation of game-specific actions like disc placement and outcome processing into different areas of the diagram can cause confusion. These should be more logically integrated to reflect the actual flow of the game. For instance, actions related to game setup, play, and conclusion should be visually and logically connected in a sequential flow to improve the developers understanding of game dynamics. The diagram should explicitly include and detail critical game functions such as "Place Disc", "Check for game over", which includes winning and draw. This addition will not only make the game rules clear but also ensure that developers and new users can easily understand how game interactions are supposed to be managed.
